Your Movie Data Guide

A simple explanation of multiple genres, directors, cast members, and how to ask AI for help.

You do not need to memorize all the code. The important idea is: each movie can connect to many genres and many people.

1. The simple idea

Before, one movie had only one text value for genre and one text value for director. Now your project can save many genres and many people for one movie. For example, Attack on Titan can have Action, Drama, and Fantasy. It can also have one director and several cast members.

Table	What it stores	Easy example
movies	Main movie or anime information	Attack on Titan
genres	Each genre only once	Action, Drama, Fantasy
genre_movie	Connects one movie to many genres	Attack on Titan -> Action
people	Names of directors and cast	Tetsuro Araki, Yuki Kaji
movie_person	Connects a movie to people and saves their role	Tetsuro Araki -> director

2. Why the role moved to movie_person

A person can be cast in one series and a director in another. So the role is saved on the movie-to-person connection, not only on the person record.

```
Movie -> Person -> Role
```

```
Attack on Titan -> Tetsuro Araki -> director
Attack on Titan -> Yuki Kaji -> cast
```

3. How to use the Create Movie form

Go to Admin Dashboard -> Create Movie. Fill in the title, rating, thumbnail, and description. Then select one or more genres. On a Mac, hold Command while selecting more than one genre. On Windows, hold Ctrl.

1. Choose genres: Action, Drama, Fantasy.
2. Write directors: one name on each line.
3. Write cast members: one name on each line.
4. Upload a JPG, PNG, or WEBP thumbnail.
5. Click Create movie.

Example form values

```
Genres: Action, Drama, Fantasy
Directors:
Tetsuro Araki

Cast members:
Yuki Kaji
Yui Ishikawa
Marina Inoue
```

4. What the important code files do

Movie model: tells Laravel that a movie has many genres and many people.

Genre model: tells Laravel that a genre can belong to many movies.

Admin Movie Controller: reads the form, validates it, creates the movie, then saves genre and credit connections.

Create Movie Blade file: shows the fields that you see in the browser.

The old genre and director text columns are still kept so your older movies continue to work. New movies also use the better connection tables.

5. How to ask AI when you are confused

You can upload this PDF, or copy a small code section, into an AI chat. Ask one clear question at a time. Include the file name and any error message.

```
Explain this Laravel code like I am a beginner. Use simple English and show one example: [paste code here]
```

```
What is the difference between people and movie_person in my movie website?
```

```
Why do I use genre_movie instead of putting many genres in one movies column?
```

```
I see this Laravel error: [paste the full error]. Tell me which file to check first. Do not change code yet.
```

```
Show me how this form data moves from create.blade.php to Admin MovieController, step by step.
```

6. A safe way to learn

First ask AI to explain. Next, ask it to show only the file that needs changing. Finally, make one small change and test it. If you get an error, copy the whole error message, not only the last line.
